Problem ——

Foam

Solution ——

Foam in a bubble bath is great - in your pool, not so much. Sometimes foam will be caused by a simple mechanical defect, such as a leak in the plumbing/filter pump. Bubbles appearing where the water returns back into the pool indicates a leak in the system. So it's a good idea to check for leaks first. You should also check the calcium hardness level to be sure your water is in balance. If there are no leaks and the calcium hardness level is acceptable, test your water for the BAQUACIL® Swimming Pool Sanitizer and Algistat. If it is too high (above 50 ppm) or if your water has an almond-like taste (which would indicate too much BAQUACIL® Algicide), you'll need to reduce those levels.

A solution is to simply stop adding BAQUACIL® Algicide until the foaming disappears. Next, only add BAQUACIL® Swimming Pool Sanitizer and Algistat if the BAQUACIL® 4-Way Test Strips indicate the need to do so. Consult your Authorized BAQUACIL® Dealer for details.
